

SPOTLIGHT YOUR COFFEE

Electromechanical and light signaling
components for coffee machines

Explore our range of standard and custom lighting components to find the solution that meets every need for the light signaling of your coffee machine.

* Please note that, in case of custom solutions, a meeting with our technical department is required for the definition, evaluation and the feasibility study.

1. MICRO-LED SPOTLIGHT

We offer **11 models of micro-LED spotlights**: these are high luminous efficiency devices to focus the attention on the preparation of the drink. They are characterized by a low working temperature, so that the final application does not overheat. They can be placed in the coffee dispensing area to **illuminate the preparation of the beverage** or mounted on the panel as an **indication of the operating status of the machine**.

2. VANDAL-PROOF LIGHT INDICATOR

We offer **3 models** of vandal-proof light indicators: high-performance light indicators and **resistant to mechanical and chemical stress**. The IP65 rating makes them resistant to steam and coffee spillage from the dispensers.

3. LIGHT INDICATOR FOR PANEL

The light indicator for panel, available for different panel hole diameters and with different lens shapes, can be mounted to **indicate the status of the machine**. It is a bright spot, shapeable **in multiple colors and light intensities**.

4. OPTICAL FIBRE

Optical fibre light profile, with monochrome or RGB source, can be applied on the sides of the coffee machine or under the worktop. It is a design detail of light that, thanks to the variation of the colors of the source, allows you to combine the functionality of the light signaling to the aesthetic of a point or line of minimal light.

5. UV-C LED MODULE

The **UV-C LED light module** is a **custom solution**, achievable on the customer's specific requirement. It can be applied, for example, on the cup warmer shelf as a solution to sanitize the coffee cups before dispensing the drink.

6. BACKLIGHT OF THE LOGO

LED backlight is a light source consisting of one or more LEDs positioned within the application. A custom logo backlight solution is to be considered as an **added value**, which gives an **aesthetic and design component** to the light of the coffee machine.
